

# Aquatrols® **Fifty90 User's Guide**

## **One Product. Many Uses.**

### **Long-Term: 90 Days**

Aquatrols® Fifty90 is an economical alternative for those interested in a longer lasting surfactant. Fifty90 is proven to remain effective in the soil for up to three months, reducing water repellency and localised dry spots. Unlike some “longer-term” surfactants, Fifty90 is effective regardless of turf type, environmental or climatic stress conditions.

- Consistent 90 day control over soil water repellency and localized dry spots.
- Does not break down due to stressful weather conditions.
- Safe for turf.
- No initial decline in turf quality that you see with many other competitive products.

Apply at 50 litres/hectare in 2000 litres of water. Apply a post-treatment syringe cycle to activate. For control beyond three months, a subsequent application of 25 litres/hectare in 1000 litres of water may be required.

Also may be applied in a split cycle using 25 litres/hectare in 1000 litres of water, followed 7-10 days later by a second application at the same rate. Apply a post-treatment syringe cycle to activate.

### **Salt Leaching: Flush salts quickly and effectively**

To leach salts out of the rootzone, a necessary component is thorough and uniform water movement through the rootzone and down to the drain lines. Fifty90 can aid in this quick penetration and wetting of the rootzone to ensure that water wets the soil thoroughly to carry salts away. Fifty90 is also safe to use with salt management products, and when coupled with applying a proper leaching fraction, ensures a successful program for salt removal.

Use Fifty90 at 6 -19 litres/hectare along with other products you may be using to manage salts, and then the leaching fraction should be applied.
